

Task 9:- Implement Exceptions and exceptional handling in Python

Aim:- To implement Exceptions and exceptional handling in Python.

Problem 9.1: You are developing a python program that processes a list of student's grades. The program is designed to allow the user to select a grade by specifying an index number. However, you need to ensure that the program handles cases where the user inputs an index that is out of range or an index that does not exist in the list.

Algorithm:-

- 1) Start the program
- 2) Initialize the list of grades [85, 90, 78, 92, 88]
- 3) Prompts the user to enter the index of the grade they wish to view
- 4) Attempt to display the grade at the specified index
- 5) If the index is out of range, catches the IndexError and prints an error message "invalid index. Please enter a valid index".

Program:-

```
# Initialize the list of grades
grades = [85, 90, 78, 92, 88]
# Display the grades list
print("Grades List:", grades)
# Prompt the user to enter the index of the grade they want to view
try:
```

Output:-

Grades lists: [85, 90, 78, 82, 88]

Enter the index of the grade you want to view: 10

Invalid index please enter a valid index

```

index = int(input("Enter the index of the grade
you want to view:"))

# Attempt to display the grade at the specified index
print("The grade at index {index} is {grades[index]}")
except IndexError:
    # Handle the case where the index is out of range
    print("Invalid index. Please enter a valid index")
except ValueError:
    # Handle the case where the input is not an integer
    print("Invalid input. Please enter a numerical index")

```

Problem 9.2 You are developing a Python calculator program that processes a list of student's grades. The program is designed to allow the user to select a grade by specifying an index index number. However, you need to ensure that the program handles cases where the user inputs an index that is out of range or an index that does not exist in the list.

Algorithm:-

- 1) Start the program
- 2) Prompts the users to enter two numbers a numerator and a denominator
- 3) Attempts to divide the numerator by the denominator
- 4) If the denominator is zero catches the zero division error and display an error message

OutPut:- Enter the numerator of fraction

8. *Leucosia* *lutea* (L.) *var.* *lutea*

Enter the denominator: ①
ERROR!

Error: Division by zero is not allowed.

```

"Error: Division by zero is not allowed!"

program:-

# Function to perform division
def divide - numbers():
    try:
        # Prompt the user to enter the numerator
        numerator = float(input("Enter the numerator"))
        # Prompt the user to enter the denominator
        denominator = float(input("Enter the denominator"))

        # Attempt to perform division
        result = numerator / denominator
        print(f"Result: {result}")
    except ZeroDivisionError:
        # Handle division by zero error
        print("Error: Division by zero is not allowed")
    # Call the function to execute the division
    operation divide - numbers()

```

Problem 9.3: You are building a Python application to determine if a person is eligible to vote based on their age or older are allowed to vote. To enforce this rules you decide to create a custom exception called invalid age exception, which will be raised whenever an age below 18 is entered.

Algorithm:-

- 1) Define the custom exception
- 2) Prompt the user for input
- 3) Check if the age is below 18
- 4) Raise an exception if the condition is met

19. Write a program to calculate the area of a rectangle.

Area = length * width

positive numbers or negative numbers.

(Exception - divide by zero)

Output: Enter a number: 100
It is positive.

Enter a number: -100
It is negative.

Exception occurred at invalid age.

Age must be between 0 and 100.

positive numbers of length &

minimum value = 1000

Exception: Age must be valid

years old are less than

years over 100 years old.

possible for a person to live more than 100 years old.

positive or negative numbers of height and width

(Exception - divide by zero)

positive numbers of length and width

length of height and width are less than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

length of height and width are greater than or equal to 1000.

3) Handle the exception with a custom error message

Program:-

```
# define Python user-defined exceptions
class InvalidAgeException(Exception):
    "Raised when the input value is less than
    18"
    pass
```

```
If you need to guess this number
number=18
```

try:-

```
    input_num = int(input("Enter a number:"))
    if input_num < number:
        raise InvalidAgeException
    else:
        print("Eligible to vote")
```

exception invalid Exception:

```
    print("Exception occurred:invalid")
```

VEL TECH	
EX NO.	
PERFORMANCE (5)	
RESULT AND ANALYSIS (5)	
EX VOCES (5)	
RECORD (5)	
TOTAL (20)	
GRADE	

Result:- Thus the program implements exceptions and exceptional handling is executed and verified successfully.
